DELUXE CARDER - OPERATING INSTRUCTIONS

1. Oil the wheel bearings before use with a light machine oil.
2. Bring the two clamps from the vertical storage position to the down operating position and clamp under the bearings with the nuts. Use the recommended setting a block of wool or wool of equal to determine the setting. Increase thicknesses and to prevent thumbpieces from marking the underside of the fabric.
3. Be sure all wool is batted before carding and do not over-feed.
4. Comments that the feed roll is collecting top trash fiber are usually due to unbat or uneven of fibers or trying to card in very short or matted staple. The feed roll is designed to remove short staples by rubbing them.
5. Hand children's fingers out of the carding teeth. Your hair, but that matter.
6. If the carder is to be left unused for long periods, oil the drive belt off the pulleys to remove the tension.
7. Keep your machine dry and do not leave it in the sun for long periods.
8. Oil the wheel shaft bearings with a few drops of light machine oil about every four or five hours of carding.
9. Keep wool cleaned off the shaft ends. Do not crack too fast.
10. Experiment with different techniques of feeding fibers. Because of its spaced wheel roll, this machine can handle great variety of fibers but different sizes of feeding fiber are not advised.
11. An unusual fine wool preparation, known as a "fine" wool, may be used. The fine wool preparation can vary from the standard wool preparation to a very fine preparation. The fine wool preparation is a wool preparation that is made up of fine wool and is prepared in a special way. It is a wool preparation that is made up of fine wool and is prepared in a special way. It is a wool preparation that is made up of fine wool and is prepared in a special way.
12. If possible, handle in batches of 100 lbs. or more. This will allow the bearings to handle the wool more uniformly and prevent the wool from becoming matted and clumped.

When other components are available which is being present for shipping, be sure the back roll is on the outside of the adjustment screw. THIS IS FOR REVERSE OPERATION.
